## Functional Description

The 'FCT374 consists of eight edge-triggered flip-flops with individual D-type inputs and TRI-STATE true outputs. The buffered clock and buffered Output Enable are common to all flip-flops. The eight flip-flops will store the state of their individual $D$ inputs that meet the setup and hold time requirements on the LOW-to-HIGH Clock (CP) transition. With the Output Enable (OE) LOW, the contents of the eight flipflops are available at the outputs. When the $\overline{\mathrm{OE}}$ is HIGH, the outputs go to the high impedance state. Operation of the $\overline{O E}$ input does not affect the state of the flip-flops.
