CONNECTION DIAGRAM PINOUT A

## 54LS/74LS390 DUAL DECADE COUNTER

DESCRIPTION - The ' 390 contains a pair of high speed 4 -stage ripple counters. Each half of the '390 is partitioned into a divide-by-two section and a divide-by-five section, with a separate clock input for each section. The two sections can be connected to count in the 8421 BCD code or they can count in a bi-quinary sequence to provide a square wave ( $50 \%$ duty cycle) at the final output.

Each half of the ' 390 contains $\mathbf{a} \div 5$ section that is independent except for the common MR function. The $\div 5$ section operates in 421 binary sequence, as shown in the $\div 5$ Truth Table, with the third stage output exhibiting a $20 \%$ duty cycle when the input frequency is constant. To obtain a $\div 10$ function having a $50 \%$ duty cycle output, connect the input signal to $\overline{\mathrm{CP}}_{1}$ and connect the $\mathrm{Q}_{3}$ output to the $\overline{\mathrm{CP}}_{0}$ input; the $\mathrm{Q}_{0}$ output provides the desired $50 \%$ duty cycle output. If the input frequency is connected to $\overline{\mathrm{C}} \bar{P}_{0}$ and the $Q_{0}$ output is connected to $\overline{C P}_{1}$, a decade divider operating in the 8421 BCD code is obtained, as shown in the BCD Truth Table. Since the flipflops change state asynchronously, logic signals derived from combinations of '390 outputs are also subject to decoding spikes. A HIGH signal on MR forces all outputs LOW and prevents counting.

ORDERING CODE: See Section 9

| PKGS | $\begin{aligned} & \text { PIN } \\ & \text { OUT } \end{aligned}$ | COMMERCIAL GRADE | MILITARY GRADE | PKG <br> TYPE |
| :---: | :---: | :---: | :---: | :---: |

LOGIC SYMBOL

$V_{C C}=\operatorname{Pin} 16$
GND $=\operatorname{Pin} 8$

INPUT LOADING/FAN-OUT: See Section 3 for U.L definitions

| PIN NAMES | DESCRIPTION | 54/74LS (U.L.) <br> HIGH/LOW |
| :--- | :---: | :---: |
| $\overline{\overline{C P}}_{0}$ | $\div 2$ Section Clock Input (Active Falling Edge) | $1.0 / 1.5$ |
| $\overline{C P}_{1}$ | $\div 5$ Section Clock Input (Active Falling Edge) | $2.0 / 2.0$ |
| $M R$ | Asynchronous Master Reset Input (Active HIGH) | $0.5 / 0.25$ |
| $Q_{0}-Q_{3}$ | Flip-flop Outputs* | $10 / 5.0$ |
|  |  | $(2.5)$ |

- The $a_{0}$ Output is guaranteed to drive the full rated fan-out plus the $\overline{\mathrm{CP}}$, input.
