## DESCRIPTION

The 8-Input Digital Multiplexer is the logical equivalent of a single-pole, 8 position switch whose position is specified by a 3-bit input address.

The 82S30 incorporates an INHIBIT input which, when low, allows the one-of-eight inputs selected by the address to appear on the foutput and, in complement, on the $\bar{f}$ output. With the INHIBIT input high, the foutput is unconditionally low and the $\bar{f}$ output is unconditionally high.

## FEATURES

- SCHOTTKY-CLAMPED TTL STRUCTURE
- PNP INPUTS
- DIRECT OUTPUT INHIBIT
- 82S80 REPLACES 9312 FOR HIGHER SPEED

"See Truth Table for Logical Conditions

NOTES:

1. All voltage measurements are referenced to the ground terminal. Terminals not specifically referenced are left electrically open.
2. All measurements are taken with ground pin tied to zero volts.
3. Positive current is defined as into the terminal referenced.
4. Positive logic definition: "UP" Level $=$ " 1 ". "DOWN" Level $=$ " 0 ".
5. Precautionary measures should be taken to ensure current limiting in accordance with Absolute Maximum Ratings should the isolation diodes become forward blased.
6. Output source current is supplied through a resistor to ground.
7. Output sink current is supplied through a resistor to $\mathrm{V}_{\mathrm{CC}}$.
8. Refer to AC Test Flgures.
9. $V_{c c}=5.25 \mathrm{~V}$
10. BY DC tests per the truth table, all inputs have guaranteed thresholds at 0.8 V for logical " 0 " and 2.0 V for logical "1".
11. All $I_{n}$ data inputs are at $0 V, V_{C C}=5.25 \mathrm{~V}$.
