

## High Speed Video Op Amp with Disable

Check for Samples: [CLC411](#)

### FEATURES

- 200MHz small signal bandwidth ( $1V_{PP}$ )
- $\pm 0.05\text{dB}$  gain flatness to 30MHz
- 0.02%, 0.03° differential gain, phase
- 2300V/ $\mu\text{s}$  slew rate
- 10ns disable to high impedance output
- 70mA continuous output current
- $\pm 4.5\text{V}$  output swing into 100 $\Omega$  load
- $\pm 4.0\text{V}$  input voltage range

### APPLICATIONS

- HDTV amplifier
- Video line driver
- High speed analog bus driver
- Video signal multiplexer
- DAC output buffer

Gain Flatness ( $A_V=+2$ )

### DESCRIPTION

The CLC411 combines a state-of-the-art complementary bipolar process with National's patented current feedback architecture to provide a very high speed op amp operating from  $\pm 15\text{V}$  supplies. Drawing only 11mA quiescent current, the CLC411 provides a 200MHz small signal bandwidth and a 2300V/ $\mu\text{s}$  slew rate while delivering a continuous 70mA current output with  $\pm 4.5\text{V}$  output swing. The CLC411's high speed performance includes a 15ns settling time to 0.1% (2V step) and a 2.3ns rise and fall time (6V step).

The CLC411 is designed to meet the requirements of professional broadcast video systems including composite video and high definition television. The CLC411 exceeds the HDTV standard for gain flatness to 30MHz with its  $\pm 0.05\text{dB}$  flat frequency response and exceeds composite video standards with its very low differential gain and phase errors of 0.02%, 0.03°. The CLC411 is the op amp of choice for all video systems requiring upward compatibility from NTSC and PAL to HDTV.

The CLC411 features a very fast disable/enable (10ns/55ns) allowing the multiplexing of high speed signals onto an analog bus through the common output connections of multiple CLC411's. Using the same signal source to drive disable/enable pins is easy since "break-before-make" is guaranteed.

## Connection Diagram

**Pinout  
DIP & SOIC**

## Typical Application

**Recommended Inverting Gain Configuration**

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## Absolute Maximum Ratings <sup>(1)</sup>

	Value	Unit
$V_{CC}$	$\pm 18$	V
$I_{OUT}$	125	mA
Common-Mode Input Voltage	$\pm V_{CC}$	V
Differential Input Voltage	$\pm 15$	V
Maximum Junction temperature	+150	$^{\circ}\text{C}$
Operating Temperature Range	-40 to +85	$^{\circ}\text{C}$
Storage Temperature Range	-65 to +150	$^{\circ}\text{C}$
Lead Temperature (Soldering 10 sec)	+300	$^{\circ}\text{C}$
ESD (Human Body Model)	1000	V

(1) "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" specifies conditions of device operation.

## Operating Ratings

Thermal Resistance		
Package	$(\theta_{JC})$	$(\theta_{JA})$
SOIC	65 $^{\circ}\text{C}/\text{W}$	120 $^{\circ}\text{C}/\text{W}$
MDIP	55 $^{\circ}\text{C}/\text{W}$	135 $^{\circ}\text{C}/\text{W}$

### Description

The CLC411 is a high speed current feedback operational amplifier which operates from  $\pm 15V$  power supplies. The external supplies ( $\pm V_{CC}$ ) are regulated to lower voltages internally. The amplifier itself sees approximately  $\pm 6.5V$  rails. Thus the device yields performance comparable to National's  $\pm 5V$  devices, but with higher supply voltages. There is no degradation in rated specifications when the CLC411 is operated from  $\pm 12V$ . A slight reduction in bandwidth will be observed with  $\pm 10V$  supplies. Operation at less than  $\pm 10V$  is not recommended.

A block diagram of the amplifier and regulator topology is shown in Figure 2, "CLC411 Equivalent Circuit." The regulators derive their reference voltage from an internal floating zener voltage source. External control of the zener reference pins can be used to level shift amplifier operation which is discussed in detail in the section entitled "Extending Input/Output Range with  $V_r$ ."

Figure 2. CLC411 Equivalent Circuit

### Power Supply Decoupling

There are four pins associated with the power supplies. The  $V_{CC}$  pins (4,7) are the external supply voltages. The  $V_{CC}$  pins (5,1) are connected to internal reference nodes. Figure 1, Figure 3 "Recommended Non-inverting Gain Circuit" and "Recommended Inverting Gain Circuit" show the recommended supply decoupling scheme with four ceramic and two electrolytic capacitors. The ceramic capacitors must be placed immediately adjacent to the device pins and connected directly to a good low inductance ground plane. Bypassing the  $V_r$  pins will reduce high frequency noise ( $>10MHz$ ) in the amplifier. If this noise is not a concern these capacitors may be eliminated.

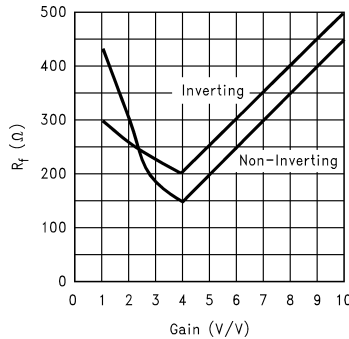

Figure 3. Recommended Inverting Gain Circuit

### Differential Gain and Phase

The differential gain and phase errors of the CLC411 driving one doubly-terminated video load ( $R_L=150\Omega$ ) are specified and guaranteed in the "Electrical Characteristics" table. The "Typical Performance" plot, "Differential Gain and Phase (4.43MHz)" shows the differential gain and phase performance of the CLC411 when driving from one to four video loads. Application note OA-08, "Differential Gain and Phase for Composite Video Systems," describes in detail the techniques used to measure differential gain and phase.

## Feedback Resistor

The loop gain and frequency response for a current feedback operational amplifier is determined largely by the feedback resistor,  $R_f$ . The electrical characteristics and typical performance plots contained within the datasheet, unless otherwise stated, specify an  $R_f$  of  $301\Omega$ , a gain of  $+2V/V$  and operation with a  $\pm 15V$  power supplies. The frequency response at different gain settings and supply voltages can be optimized by selecting a different value of  $R_f$ . Generally, lowering  $R_f$  will peak the frequency response and extend the bandwidth while increasing its value will roll off the response.

**Figure 4. Recommended  $R_f$  vs. Gain**

For unity gain voltage follower circuits, a non-zero  $R_f$  must be used with current feedback operational amplifiers such as the CLC411. Application note OA-13, "Current-Feedback Loop-Gain Analysis and Performance Enhancements," explains the ramifications of  $R_f$  and how to use it to tailor the desired frequency response with respect to gain. The equations found in the application note should be considered as a starting point for the selection of  $R_f$ . The equations do not factor in the effects of parasitic capacitance found on the inverting input, the output nor across the feedback resistor. Equations in OA-13 require values for  $R$  ( $301\Omega$ ),  $A_v(+2)$  and  $R_i$  (inverting input resistance,  $50\Omega$ ). Combining these values yields a  $Z_t$  (optimum feedback transimpedance) of  $400\Omega$ . Figure 4 entitled "Recommended  $R_f$  vs. Gain" will enable the selection of the feedback resistor that provides a maximally flat frequency response for the CLC411 over its gain range.

The linear portion of the two curves (i.e.  $A_v > 4$ ) results from the limitation on  $R_g$  (i.e.  $R_g \geq 50\Omega$ ).

**Figure 5. Disable Interface**

Figure 6. Differential ECL Interface

Figure 7. ECL Interface

Figure 8. TTL Interface

### Enable/Disable Operation

The disable feature allows the outputs of several CLC411 devices to be connected onto a common analog bus forming a high speed analog multiplexer. When disabled, the output and inverting inputs of the CLC411 become high impedances. The disable pin has an internal pull up resistor which is pulled up to an internal voltage, not to an external supply. The CLC411 is enabled when pin 8 is left open or pulled up to  $\geq +7V$  and disabled when grounded or pulled below  $+3V$ . CMOS logic devices are necessary to drive the disable pin. For example, CMOS logic with  $V_{DD} \geq +7V$  will guarantee proper operation over temperature. TTL voltage levels are inadequate for controlling the disable feature.

For faster enable/disable operation than 15V CMOS logic devices will allow, the circuit of Figure 5 is recommended. A fast four transistor comparator, Figure 5, interfaces between the CLC411 DISABLE pin and several standard logic families. This circuit has a differential input between the bases of Q1 and Q2. As such it may be drive directly from differential ECL logic, as in shown in Figure 6. Single-ended logic families may also be used by establishing an appropriate threshold voltage on the  $V_{th}$  input, the base of Q2.

**Figure 9. General Multiplexing Circuit**

Figure 7 and Figure 8 illustrate a single-enabled ECL and TTL interface respectively. The Disable input, the base of Q1, is driven above and below the threshold,  $V_{th}$ .

Fastest switching speeds result when the differential voltage between the bases of Q1 and Q2 is kept to less than one volt. Single-ended ECL, Figure 7, maintains this desired maximum differential input voltage. TTL and CMOS have higher  $V_{high}$  to  $V_{low}$  excursions. The circuit of Figure 8 will ensure the voltage applied between the bases of Q1 and Q2 does not cause excessive switching delays in the CLC411. Under the above proscribed four transistor interface, all variations were evaluated with approximately 1ns rise and fall times which produced switching speeds equivalent to the rated disable/enable switching times found in the "CLC411 Electrical Characteristics" table.

A general multiplexer configuration using several CLC411s is illustrated in Figure 9, where a typical 8-to-1 digital mux is used to control the switching operation of the paralleled CLC411s. Since "break-before-make" is a guaranteed specification of the CLC411 this configuration works nicely. Notice the buffers used in driving the disable pins of the CLC411s. These buffers may be 15V CMOS logic devices mentioned previously or any variation of the four-transistor comparator illustrated above.

### Extending Input/Output Range with $V_r$

As can be seen in Figure 3, the magnitude of the internal regulated supply voltages is fixed by  $V_z$ . In normal operation, with  $\pm 15V$  external supplies,  $+V_r$  is nominally  $+9V$  when left floating. CMIR (common mode input range) and VO (output voltage range, no load) are specified under these conditions. These parameters implicitly have 0V as their midpoint, i.e. the VO range is  $\pm 6V$ , centered at 0V.

Figure 10. DC Parameters as a Function of  $+V_r$

An external voltage source can be applied to  $+V_r$  to shift the range of the input/output voltages. For example, if it were desired to move the positive VO range from +6V to a +9V maximum in unipolar operation, Figure 10, "DC Parameters as a Function of  $+V_r$ " is used to determine the required supply and  $+V_r$  voltages. Referring to Figure 10, locate the point on the  $+V_{O_{max}}$  line where the ordinate is +9V. Draw a vertical line from this point intersecting the other lines in the graph. The circuit voltages are the ordinates of these intersections. For this example these points are shown in the graph as solid dots. The required voltage sources are  $+V_r = +12V$ ,  $+V_{CC} = +12V$ ,  $-V_{CC} = -12V$ . When these supply and reference voltages are applied, the range for VO is -3V to +9V, and CMIR ranges from -1V to +7V. The difference between the minimum and maximum voltages is constant, i.e. 12V for VO, only the midpoint has been shifted, i.e. from 0V to +3V for VO.

Note that in this example the  $-V_r$  pin has been left open (or bypassed to reduce high-frequency noise). The difference between  $+V_r$  and  $-V_r$  is fixed by  $V_z$ . A level-shifting voltage can be applied to only one of the reference pins, not both. If extended operation were needed in the negative direction, Figure 4 may be used by changing the signs, and applying the resultant negative voltage to the  $-V_r$  pin. It is recommended that  $+V_r$  be used for positive shifts, and  $-V_r$  for negative shifts of input/output voltage range.

#### Printed Circuit Layout and Evaluation Board

Refer to application note OA-15, "Frequent Faux Pas in Applying Wideband Current Feedback Amplifiers," for board layout guidelines and construction techniques. Two very important points to consider before creating a layout which are found in the above application note are worth reiteration. First the input and output pins are sensitive to parasitic capacitances. These parasitic capacitances can cause frequency-response peaking or sustained oscillation. To minimize the adverse effect of parasitic capacitances, the ground plane should be removed from those pins to a distance of at least 0.25". Second, leads should be kept as short as possible in the finished layout. In particular, the feedback resistor should have its shortest lead on the inverting input side of the CLC411. The output is less sensitive to parasitic capacitance and therefore can drive the longer of the two feedback resistor connections. The evaluation board available for the CLC411 (part #730013 for through hole packages, 730027 for SO8) may be used as a reference for proper board layout. Application schematics for this evaluation board are in the product accessories section of the National databook.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
