

*Advanced Information***Advanced Digital Video Encoder
Y/Cb/Cr Output Support
HCMOS Technology**

The MC44722A and MC44723A are advanced Digital Video Encoders (DVE). They convert ITU-601/656 standard 4:2:2 Bit-Parallel data into analog composite video, S-Video or analog component signals Y/Cb/Cr in PAL and NTSC formats. They accept the multiplexed two 8-bit or 16-bit ((CB,Y,CR)Y) signals from digital sources such as MPEG decoders and can act as a sync generator master or as a sync slave. All video processing is done digitally and requires no external adjustment.

Specifically designed for digital satellite, digital cable decoders, multimedia terminals and DVD players.

- World Wide Operation (PAL-BDGHI, PAL-N,PAL-M, NTSC-M)
- SMPTE 170M / ITU - R 624 composite video output
- Programmable Color Sub-carrier Frequencies
- Analog standard timing for Horizontal, Vertical, Frame and Composite Sync Outputs
- Sync Extraction From Digital Input Data (SAV, EAV)
- Sync Polarity and Horizontal / Vertical Phase Control
- Master or Slave Sync (H/Vsync, H/Fsync, ITU-R656 Slave) Operation
- Interlaced or Non-Interlaced Support
- 625/50 or 525/60 ITU-601/656 two 8-bit or 16-bit ((CB,Y,CR)Y) Digital Input
- Luma 2X / Chroma 4X Output interpolating Filter
- Dual Digital A / B selectable inputs
- External VBI Information Data Input (Teletext Information Data)
- Selectable One set of Signal within (CVBS/Y/C) or (Y/Cb/Cr)
- Selectable Analog Component Output (Beta Cam or MII Component Interface Level)
- Three Analog Outputs Through 10-bit DACs
- Easily programmed via Serial Bus (I2C or 4-Wired SPI Bus)
- 2 Hardware selectable I2C Chip Addresses
- Closed-Caption, CGMS and WSS Information data Insertion
- MACROVISION ver. 7.01 Anti-Copy Signal Insertion(MC44722A Only)
- On Chip Color - bar Generator
- 5V Tolerante Input
- +3.3V Power Supply or +3.3V(Digital)/+5V(Analog) Power Supply
- Pin Compatible with MC44722/3

The MC44722A device is protected by U.S. patent number 4,631,603,4,577,216 and 4,819,098 and other intellectual property rights. The use of Macrovision's copy protection technology in the device must be authorized by Macrovision and is intended for home and other limited pay-per-view uses only, unless otherwise authorized in writing by Macrovision. Reverse engineering or disassembly is prohibited.

[Function Descriptions]

Clock

27.0MHz. This signal on the clock pin needs to be active and stable for 5 cycles before the reset pin is de-asserted.

Reset Procedure

RESET is a level sensitive input pin. Driving the RESET pin low causes a DVE reset. The 27Mhz DVE clock signal must be active before RESET is released. De-asserting reset will latch the status of the PAL/NTSC, Vmute and SEL pins.

The PAL/NTSC pin determines the default values for the DVE control registers. The default register values have been chosen so that standard PAL or NTSC video will appear at the DAC outputs immediately when a valid input digital video data stream is present and Vmute is Low at reset.

The Vmute pin controls the "out of reset" operation of the Analog output signals. When "1" at reset, the video output is muted - output signal is "black - sync". When "0" at reset, the video output is from the input video data. This control can be used to mute the disable noise signals from a MPEG decoder at reset until a clear and stable picture is available.

The value on the SEL pins determine the default serial communication mode. If Low, the DVE use I2C bus operation. If High, the DVE use 4-wired SPI operation.

After reset, the VBI signals (Closed-Caption, CGMS and WSS) are disabled.

(see page --- for sub-address register descriptions.)

Fig 1 : DVIA/DVIB Data Input Timing

Fig 2 : Sync Data Output Timing

Input Data Format

The input digital video is in accord with the ITU-R Rec.656 and SMPTE 125M standards. It is two 8-bit or 16-bit multiplexed 4:2:2 ((CB,Y,CR)Y) data stream. Samples are latched on the rising edge of the clock signal. Data is input on pins **DVIA[7 : 0]** and **DVIB[7 : 0]** (see figures 3 and 4 for sub-address register descriptions.)

Video Timing / Sync Generator

The DVE outputs PAL-B,D,G,H,I, PAL-N, PAL-M or NTSC-M standard video signals.

The DVE sync generator can be operated in two sync modes, master or slave.

In master mode, the DVE generates all the correct Horizontal and Vertical or Frame sync signals internally, and outputs the Csync signal through the C/Fsync/VBI pin(C/Fsync).

In slave mode, the DVE derives the sync signals from the Bit-Parallel input data stream Start Active Video (SAV) and End Active Video (EAV) data packet information. Sync signals are output on the Hsync and F/Vsync or C/Fsync/VBI pins and can be programmed for positive or negative polarity. The phase of Hsync can also be controlled.

Also, the DVE allows more two slave modes. One is H/Vsync slave, and the another is H/Fsync slave mode.

Vertical Blanking corresponds to the following lines.

625/50 624-22 311-335 ITU-R line numbering
525/60 1-19 264-282 SMPTE line numbering

(see figures 3,4,5,6,7,8,9,10, and 11 for sub-address register descriptions.)

sub-address71[1:0] =10, 11

Chroma / Luma Encoding

The DVE de-multiplexes the 4:2:2 digital video data stream.

The de-multiplexed Y or Luma samples are interpolated at the clock rate. Offset compensation is then added, next any VBI signals consisting of Closed-Caption, CGMS and WSS are added to the appropriate lines, then finally composite sync pulses are added to the Luma signal.(see figure 14.)

De-multiplexed component color CB and CR samples are interpolated at the clock rate.

The Luma and Chroma Interpolation filter compensate for the $\sin(x)/x$ attenuation to on chip D/A converter and simplify the output filter and allows more accurate encoding. A set of 3 different filters is available for each Luma and Chroma filtering. And user can select within these filters to fit a wide variety of applications. (see figure 12 and 13, and sub-address register 6F)

The DVE generates the necessary subcarrier color frequency for PAL or NTSC encoding from the 27Mhz system clock. This color subcarrier is then modulated by the base band component color CB and CR signals to create the video Chroma signal. (see figure 15.)

A 7.5 IRE pedestal is added for the 60Hz field rate. This can be added for the 50Hz field rate through serial bus control. (see sub-address register descriptions)

Fig. 12 Luma Filtering Including DAC Attenuation

Fig. 13 Chroma Filtering

"CVBS and S-VIDEO" or "YCbCr" Outputs

The internal digital video signals drive 10-bit D/A converters. Converter outputs are bidirectional current sources where the current is proportional to the digital data with reference to the IBIAS reference current. The pins CVBS/Cb, Y and C/Cr are the respective composite, Luma and Chroma or Y/Cb/Cr signal current source pins. Each of the DACs can drive **75ohm** load resistor.

User can select 1 sets of signals from the above 2 signal sets (CVBS/Y/C or Y/Cb/Cr). (see "Application Diagram" and "sub-address register descriptions".)

In Y/Cr/Cb analog component output mode, user can select one of the component interface level , Beta Cam or M2 format (see sub-address register 6E).

Bias Current Gain

DACs can be switched off through serial bus control to reduce power consumption. Both outputs of unused DACs should be connected to ground through a resistor to avoid charge buildup.

Copy Generation Management System (CGMS) Encoding

CGMS signals can be encoded by the DVE onto output video line 20 (525 / 60 for Japan).
CGMS identification signals also identify and control the TV screen presentation mode - wide screen, letter box and or normal -16:9 or 4:3.
Data is Double-Buffered and is latched at the start of Field 1.

CRC code is generated by controlling \$88 [0] CGMS_parity bit automatically.

(see figures 24 for sub-address register descriptions.)

Wide Screen Signaling (WSS) Encoding

WSS signals can be encoded by the DVE onto output video line 23 (625 / 50 for Europe).
WSS identification signals also identify and control the TV screen presentation mode - wide screen, letter box and or normal -16:9 or 4:3.
Data is Double-Buffered and is latched at the start of Field 1.

Odd parity code is generated by controlling \$88 [1] WSS_parity bit automatically.

(see figures 25 for sub-address register descriptions.)

Closed-Caption Encoding

Closed-Captioned or Extended Data Service signals can be encoded by the DVE onto output video line 21/284 (NTSC) and line 22/335 (PAL). The CC data is input through the serial bus interface. Two 8-bit byte data pairs are encoded for each field. There are four registers for holding the data - two bytes per field. The serial data is 7bit US-ASCII MSB first, preceded by an odd parity bit. Total 8-bits. (P-7-6-5-4-3-2-1-0)

The DVE automatically generates the required clock run in and start bit for CC encoding. (see figure 16.)
When Closed-Captioning is enabled, the system micro processor (uP) should update the CC data once each frame. This DVE will automatically NULL characters when there is no CC data to encoder after the CC data has been processed by setting the \$87[5] register.

It is recommended to write CC data only to the inactive frame. Field1 and Field2 data are double-buffered by the Frame sync falling edge of previous Frame, updating Frame 2 data during Frame1 display and Frame1 data during Frame2 display.

When the \$87[4] register is set, the DVE will generate the parity bit automatically.

(see figures 26 and 27 for sub-address register descriptions.)

Serial Control Bus

Control of the DVE device is accomplished through the **I2C-Bus** or 4-wired **SPI** serial bus. In I2C mode, pins **SDA** and **SCL** are the respective data and clock signals. Device address can be 42(hex)/43(hex) or 1C(hex)/1D(hex). Slave address is chosen at reset by the state of the ChipA pin signal { 0 : 42(hex)/43(hex), 1 : 1C(hex)/1D(hex) }
Sub-address register read and write operations are documented in the following figures 22a - 22b.

In SPI mode, pins **SO**, **SI**, **SCK** and **SEL** are the respective data input, output, serial clock and chip select signals. Register read and write operations are documented in the following figures 23a - 23b

MACROVISION™ Copy Protection

When enabled, the Luma and Chroma signals are modified according to the MACROVISION™ copy protection process for Pay Per View (PPV) and DVD applications revision **7.01** dated Sep 6th, 1996.

Enabling and control is through the serial control bus.

No MC44722A parts will be sent to the customer until the customer provides MOTOROLA with written confirmation of a license, non-disclosure or a waiver from MACROVISION™.

The MC44723A device is available without MACROVISION™ encoding.

 - 1 : narrow 2.5Mhz
- V Fil, U Fil mode0 : Chroma Filter switch
 - 0 : wide 3.0MHz(default)
 - 1 : narrow 1.5MHz
- Cr Fil, Cb Fil mode 0 : Cr/Cb Filter switch
 - 0 : wide 3.0MHz(default)
 - 1 : narrow 1.5MHz
- Cr /Cb Fil mode 1 : wide Filter switch
 - 0 : wide0 3.0MHz(default)
 - 1 : wide1 2.5MHz
- Y Fil mode 1 : wide Filter switch
 - 0 : wide0 6.0MHz(default)
 - 1 : wide1 5MHz

Sub-address 70 : Variable I/O Switch (write/read)

| | | | | | | | | |
|-------------|--------------------------|---------|------------------|---------|------------|------------|-----------|-----------|
| | MSB | | | | | | | LSB |
| Register 70 | bs-off | self-SW | color bar select | VBLK SW | C/Fsync SW | F/Vsync SW | M/S mode1 | M/S mode0 |
| | default : 0000_0001(bin) | | | | | | | |

bs - off : color burst control switch On/Off
 0 : color burst ON (default)
 1 : color burst OFF

self - SW : internal self H/V counter reset switch On / Off
 0 : self counter reset OFF (default)
 1 : self counter reset ON
 Note : this mode is ONLY valid at when 70h[1: 0] is "10(bin)" or "11(bin)".

color bar select : color bar select

| | Luma | Chroma |
|---------------|------|--------|
| 0 : color bar | 100% | 75% |
| 1 : color bar | 100% | 100% |

VBLK SW : Vertical Blanking Mask Enable switch On-Off
 0 : reject VBI information data in vertical blanking period (default)
 1 : through VBI information data in vertical blanking period

C/Fsync SW : Composite sync/Frame sync output switch
 0 : Frame sync output (default)
 1 : composite sync output

F/Vsync SW : Frame sync /Vertical sync output switch
 0 : Vertical sync output (default)
 1 : Frame sync output

M/S sync mode1 : Master or Slave sync mode
 M/S sync mode0 : 00 : 601 H/V master mode
 01 : 656 slave mode(no H/Vsync output) (default)
 10 : Fsync/Hsync slave mode
 11 : Vsync/Hsync slave mode

Sub-address 71 : Sync control (write/read)

default : 0000_0100(bin)

- non-inter : non-interlaced mode select
0 : interlace mode (default)
1 : non-interlace mode
 - VBI SW : vertical blanking information signal input control switch on 34 pin
0 : VBI input Off (default)
1 : VBI input On
 - h-polarity : polarity of Hsync
0 : negative (default)
1 : positive
 - v-polarity : polarity of Vsync
0 : negative (default)
1 : positive
 - f-polarity : polarity of Fsync
0 : field1 (odd) = low level (default)
1 : field1 (odd) = high level
 - h-delay2 : delay on Hsync with reference to DVIA/DVIB data in Master mode
 - h-delay1 : 000: + 4 clock delay
 - h-delay0 : 001: + 3 clock delay
010: + 2 clock delay
011: + 1 clock delay
100: + 0 clock delay
101: - 1 clock delay
110: - 2 clock delay
111: - 3 clock delay
- Note : this h-delay can be also related with 7A[7:0] register and can delay totally +2023 clock delay in H/V or H/Fsync slave mode.

Sub-address 72 : PAL/NTSC setup (write / read)

| | | | | | | | | |
|-------------|-----------|------|-----------------------|-----------|---------|---------|---------------|---------------|
| | MSB | | | | | | | LSB |
| Register 72 | phase-set | TEST | C/Fsync/VBI I/O SW | color bar | setup75 | 625/525 | PAL/ NTSC2 | PAL/ NTSC1 |

default : 0000_1000(bin) NTSC (If "PAL/NTSC" pin is LOW level)
0000_0101(bin) PAL

- phase-set : color sub-carrier phase synchronization
0 : free running (default)
1 : 1 phase reset/8 field and 1 phase reset/4 frame
- TEST : for test, should be "0"
- C/Fsync/VBI I/O SW : Input/Output switch on 34 pin (C/Fsync/VBI pin)
0 : VBI input(default)
1 : Csync or Frame sync output
- color bar : internal color bar generator control
0 : normal operation (default)
1 : color bar generator On
(need to set color bar mode on sub-address 70[5].)
- setup75 : Setup level for Luminance
0 : setup level for luminance = 0IRE
1 : setup level for luminance = 7.5IRE
- 625/525 : control line mode
0 : 525 lines / 60 Hz mode
1 : 625 lines / 50 Hz mode
- PAL/NTSC2 : subcarrier control
PAL/NTSC1 00 : NTSC(M)
01 : PAL (BDGHI)
10 : PAL (M)
11 : PAL (N)

Sub-address 73: Vertical Blanking Information Luma (Y) Level (write only)

Sub-address 74: Burst Chroma (U) Level (write only)

Sub-address 75: Burst Chroma (V) Level (write only)

Sub-address 76 : DAC set 1 signal control (write only)

Cr : Cr/Cb signal control (Data path enable)

Cb : Cr, Cb On (default)
1 : chrominance Off

Luma : Luminance control (Data path enable)

0 : luminance On (default)
1 : luminance Off

dac 1pin : D/A converter (1) output On-Off control

dac 4pin : 0 : CVBS/Cb DAC, C/Cr DAC, Y DAC output On (default)
dac 7pin : 1 : CVBS/Cb DAC, C/Cr DAC, Y DAC output Off

dac set 1 mode : 1~9-pin's D/A converter output signal control

10 : Y/Cr/Cb output On
00 : Y/C/CVBS output On

Sub-address 77 : reserved

Sub-address 78~79 : Sub-carrier phase control (write only)

sc-ph9 : sub-carrier phase control
sc-ph8 00_0000_0000 : sub-carrier phase 0 degree (default)
sc-ph7 to
sc-ph6 11_1111_1111 : sub-carrier phase 359 degree
sc-ph5
sc-ph4
sc-ph3
sc-ph2
sc-ph1
sc-ph0

Sub-address 7A : Hsync delay control (write only)

- h-delay10 : delay on Hsync with reference to DVIA/DVIB data
- h-delay9 0000_0000_000 : Hsync delay 0 delay
- h-delay8 to
- h-delay7 1111_1111_000 : Hsync delay +255 delay
- h-delay6
- h-delay5
- h-delay4
- h-delay3

Note : this h-delay can be also related with 71[3:0] register and can delay totally +2023 delay(1111_1111_111) in H/V or H/Fsync slave mode.

Sub-address 7B : Digital Video Input Select Control (write only)

- Cr_tmg : Cr clock timing delay in 16-bit Digital Input Mode
 - 00 : Cr clock delay 0 clock (default)
 - 01 : Cr clock delay +1 clock
 - 10 : Cr clock delay +2 clock
 - 11 : Cr clock delay +3 clock (See fig 3,4)
- Cb_tmg : Cb clock timing delay in 16-bit Digital Input Mode
 - 00 : Cb clock delay 0 clock (default)
 - 01 : Cb clock delay +1 clock
 - 10 : Cb clock delay +2 clock
 - 11 : Cb clock delay +3 clock (See fig 3,4)
- Y_tmg : Y clock timing delay in 16-bit Digital Input Mode
 - 0 : Y clock delay 0 clock (default)
 - 1 : Y clock delay +1 clock
- 16-bit input mode : 16-bit YY / CbCr Digital Video Input mode
 - 0 : 8-bit Multiplexed CbYCrY Digital Video Input mode (default)
 - 1 : 16-bit YY / CbCr Digital Video Input mode

Sub-address 7C : signal control 3(write only)

default : 0000_0000(bin)

Y sync : Y sync Signal On/Off (Y/Cb/Cr mode only)
0 : Y sync On (default)
1 : Y sync Off

CbCr bf : CbCr burst On/Off
0 : Cb/Cr bf data Off
1 : Cb/Cr bf data On

Chroma bf : Chroma burst On/Off
0 : Chroma bf data On
1 : Chroma bf data off

Sub-address 7D~7E : Vsync delay control (write only)

V-delay9 : delay on Vsync with reference to DVIA/DVIB data in slave mode
V-delay8 0000_0000_00 : Vsync delay 0 delay
V-delay7 to
V-delay6 1111_1111_11 : Hsync delay +1023 delay
V-delay5
V-delay4
V-delay3
V-delay2
V-delay1
V-delay0

Sub-address 80~82: CGMS characters for Field1(Line20)/Field2(Line283) (write only)

NTSC only

Fig 20 : CGMS wave form

Sub-address 80~81: WSS characters for Line23 (write only)

PAL only

Fig 21 : WSS wave form

Sub-address 83~84 :closed caption characters/extended data for Field1(Line21) (write)

First byte to Encode

Second byte to Encode

Sub-address 85~86 :closed caption character/extended data for Field2(Line284)

First byte to Encode

Second byte to Encode

Fig 22 : Closed caption wave form

Note : This Closed Caption waveform is defined by when the register \$72 [3] = "1" is set

sub-address 80, 81, 82, 83, 84, 85 and 86 (previous frame data) are double-buffered by Frame sync falling edge

Fig 23 : VBI data update timing

Sub-address 87 :Closed caption / CGMS / WSS

default 00h

CC2_flag : Closed Caption Status Flag for field2/field1 (Read only)
 CC1_flag 0 : Automatically set to " 1 " when 2-byte Closed Caption data are written, and then cleared to "0" when the data is send to doubled buffer
 1 : Do NOT work " 1 " to these bits. " 0 " is correct.

CC_null : Automatically set the null code when the data is send to doubled buffer
 0 : Keep the current CC data in the resister.
 1 : Automatically set the null code in the CC data resister

CC_parity: CC Parity Generation On-Off
 0 : Use parity bit in data. (default)
 1 : Automatically generate parity bit.

WSS : WSS information data insertion On-Off
 0 : WSS information data insertion Off
 1 : WSS information data insertion On

CGMS : CGMS information data insertion On-Off
 0 : CGMS information data insertion Off
 1 : CGMS information data insertion On

CC2 : closed caption/extended data for field2 encoding On-Off
 0 : closed caption/extended data for field2 encoding Off
 1 : closed caption/extended data for field2 encoding On

CC1 : closed caption/extended data for field1 encoding
 0 : closed caption/extended data for field1 encoding Off
 1 : closed caption/extended data for field1 encoding On

Sub-address 88 :CGMS/WSS Parity Generation On-Off

default 00h

WSS_parity
 CGMS_parity :WSS/CGMS Parity Generation On-Off
 0 : Use parity bit in data. (default)
 1 : Automatically generate parity bit.
