

MC92501

Advance Information ATM Cell Processor

The MC92501 is an Asynchronous Transfer Mode (ATM) Cell Processor layer device composed of dedicated high-performance ingress and egress cell processors combined with UTOPIA Level 2-compliant physical (PHY) and UTOPIA Level 1-compliant switch interface (see **Figure 1**). It integrates address translation, UPC/NPC, OAM, and statistical functions into a single semiconductor device. This second generation ATM cell processor in Motorola's MC92500 series can be used both in the line cards used by the switching systems in the ATM network core and in the access multiplexer. The primary function of the MC92501 in either application is to provide ATM-layer cell processing and routing functions. The advanced ATM functionality permits simultaneous transmission of voice, video, and data within broadband services such as high-speed Internet operations, LAN interconnections for commuters, and video-on-demand using a variety of applications such as Digital Subscriber Line Access Multiplexers (DSLAMs), Wide-Area Networks (WANs), Enterprise Switches, and Multi-service Platforms,

Data Sheet Conventions

This data sheet uses the following conventions:

OVERBAR Used to indicate a signal that is active when pulled low (For example, the RESET pin is active when low.)

asserted Means that a high true (active high) signal is high or that a low true (active low) signal is low

deasserted Means that a high true (active high) signal is low or that a low true (active low) signal is high

Examples:	Signal/Symbol	Logic State	Signal State	Voltage
	$\overline{\text{PIN}}$	True	Asserted	V_{IL}/V_{OL}
	$\overline{\text{PIN}}$	False	Deasserted	V_{IH}/V_{OH}
	PIN	True	Asserted	V_{IH}/V_{OH}
	PIN	False	Deasserted	V_{IL}/V_{OL}

Note: Values for V_{IL} , V_{OL} , V_{IH} , and V_{OH} are defined by individual product specifications.

New Features in the MC92501

- Implements ATM Layer functions for Broadband ISDN according to ANSI recommendations, ATM Forum UNI 4.0 and TM 4.0 Specifications, ITU recommendations, and Bellcore recommendations.
- Provides ABR Relative Rate marking and EFCI marking according to TM 4.0
- Select Discard CLP = 1 (or CLP = 0 + 1) Flow on selected connections
- UTOPIA Level 2 PHY Interface and UTOPIA ATM Layer Interface
- Supports both Partial Packet Discard (PPD) and Early Packet Discard (EPD)
- Change ABR RM Cell priority
- Supports CLP transparency
- Unidirectional (Ingress or Egress) UPC or NPC

Standard ATMC Features in the MC92500 Family

- Full duplex operation at data rates up to 155 Mbps
- Performs internal VPI and VCI address compression for up to 64 K VCs
- CLP-Aware peak, average, and burst-length policing with programmable Tag/Drop action per policer
- Supports up to 16 physical links using dedicated Ingress/Egress multiPHY control signals
- Each physical link can be configured as either a UNI or NNI port
- Supports multicast, multiport address translation
- Maintains both virtual connection and physical link counters on both Ingress and Egress cell flows
- Provides a flexible 32-bit external memory port for context management
- Automated AIS, RDI, CC, and loopback functions with performance monitoring block test on all 64 K connections
- Programmable 32-bit microprocessor interface supporting Big-Endian or Little-Endian bus formats
- Unidirectional (Ingress only) UPC or NPC design with up to four leaky buckets per connection
- Supports a programmable number of additional switch overhead parameters allowing adaptation to any switch routing header format
- Provides per-link cell counters in both directions

Product Documentation

The three documents listed in the following table are required for complete description of the MC92501 and are necessary to design properly with the part. Documentation is available from one of the following locations (see back cover for detailed information):

- A local Motorola distributor
- A Motorola semiconductor sales office
- A Motorola Literature Distribution Center
- The World Wide Web (WWW)

Table 1. MC92501 Documentation

Name	Description	Order Number

Signal Descriptions

1.1 Signal Groupings

The input and output signals of the MC92501 are organized into functional groups, as shown in **Table 1-1** and as illustrated in **Figure 1-1**. The MC92501 is operated from a 3.3 V supply; however, some of the inputs can tolerate 5 V. A special note for this feature is added to the signal descriptions of those inputs.

Table 1-1. MC92501 Functional Signal Groupings

Functional Group	Number of Signals	Detailed Description
Power (VDD and AVDD) and Ground (VSS and AVSS)	47	Table 1-2
Control	4	Table 1-3
Processor Interface	68	Table 1-4
Ingress PHY Interface	17	Table 1-6
Egress PHY Interface	18	Table 1-7
PLL	4	Table 1-8
External Memory Interface	64	Table 1-9
Ingress Switch Interface	13	Table 1-10
Egress Switch Interface	13	Table 1-11
JTAG Interface	5	Table 1-12

Figure 1-1. Functional Signal Groups

1.2 Power and Ground Signals

Table 1-2. Power and Ground Signals

Signal Name	Description
VDD	Input Power
AVDD	PLL Analog Power —Isolate this input to eliminate coupling of digital switching noise into the PLL
VSS	System Ground
AVSS	PLL Analog Ground —Isolate this input to eliminate coupling of digital switching noise into the PLL

1.3 Control Signals

Table 1-3. Control Signals

Signal Name	Signal Type	Detailed Description
$\overline{\text{ARST}}$	Input	ATMC Power-up Reset —This input signal is used for power-up reset of the entire chip. It must be asserted for at least the time required by the PLL to stabilize.
AMODE0– AMODE1	Input	ATMC Mode —These input signals determine the operating mode of the chip's test features. In normal usage these pins should be grounded.
ENID	Input	Enable IDD —This input pin is used for test purposes. In normal usage the ENID pin must be grounded.

Note: All inputs are 5 V tolerant.

1.4 Processor Interface Signals

Table 1-4. Processor Interface Signals

Signal Name	Signal Type	Detailed Description
MCLK	Input	MP Clock —This input signal is used as the Microprocessor clock inside the MC92501. This signal drives the microprocessor logic in the MC92501. The duty cycle should be in the range of 40–60%.
MADD2– MADD25	Input	MP Address Bus —This input bus contains the address which is used by the microprocessor to define the register being accessed. This bus is used by the MC92501 at the assertion of MSEL and sampled on the falling edge of MCLK.
MWR	Input	MP Write —This input signal is used to determine whether the MP is reading from the MC92501 or writing to it. This signal is sampled by the MC92501 on the falling edge of MCLK. The MC92501 drives MDATA when MSEL = 0 and MWR = 1.
MSEL	Input	MP Select —This input signal is used to determine that the current access to the MC92501 is valid. This signal is sampled by the MC92501 on the falling edge of MCLK.
MDS	Input	MP Data Select —This input signal is used to indicate when the data on MDATA is valid during a write access to the MC92501. This signal is sampled by the MC92501 on the falling edge of MCLK.
MWSH A1	Input Input	MP Word Write Enable High —This signal indicates that the high word is being written. During a maintenance write access, the value detected on MWSH/A1 is driven on the appropriate EMBSH signal. During read access EMBSH signal is always asserted. Address 1 —When configured appropriately during a maintenance write access, this signal serves as Address 1. During a read access, this signal is ignored. Note: This input signal is programmed by the <i>Word Select Signals Mode (WSSM)</i> bit in the Microprocessor Configuration Register (MPCONR). The signal is sampled by the MC92501 on the falling edge of MCLK. Table 1-5 describes the combined MWSH/A1 and MWSL/Size functionality
MWSL SIZE	Input Input	MP Word Write Enable Low —This signal indicates that the high word is being written. During a maintenance write access, the value detected on MWSL/SIZE is driven on the appropriate EMBSL signal. During read access EMBSL signal is always asserted. Access Size —When configured appropriately during a maintenance write access, this signal indicates the size of the maintenance write access: either 32 bits or 16 bits access. During a read access, this signal is ignored and the access width is 32 bits. Note: This input signal is programmed by the <i>Word Select Signals Mode (WSSM)</i> bit in the Microprocessor Configuration Register (MPCONR). The signal is sampled by the MC92501 on the falling edge of MCLK. Table 1-5 describes the combined MWSH/A1 and MWSL/Size functionality

Table 1-4. Processor Interface Signals (Continued)

Signal Name	Signal Type	Detailed Description
MDTACK0– MDTACK1	Output	MP Data Acknowledge 0–1 —These tri-statable output signals are used to indicate the end of an access from the MC92501. At the end of each access, this signal is actively pulled up and then released. The user may program the MC92501 not to drive this signal during certain types of accesses. This signal is output asynchronously to MCLK.
MDATA0– MDATA31	Input/Output	MP Data Bus —This tri-state bidirectional bus provides the general data path between the MC92501 and the microprocessor.
MINT	Output	MP Interrupt —This output signal is used to notify the microprocessor of the occurrence of interrupting events. This signal is asserted on the rising edge of ACLK (asynchronous with respect to MCLK).
$\overline{\text{MREQ0}}$	Output	MP Request 0 —This output signal can be programmed to one of three options (described below in note 2). Its default value is option #1: MP Cell In Request (MCIREQ).
$\overline{\text{MREQ1}}$	Output	MP Request 1 —This output signal can be programmed to one of three options (described below in note 2). Its default value is option #2: MP Cell Out Request (MCOREQ)..
$\overline{\text{MREQ2}}$	Output	MP Request 2 —This output signal can be programmed to one of three options (described below in note 2). Its default value is option #3: External Memory Maintenance Request (EMMREQ).

- Notes:**
- All inputs are 5 V tolerant.
 - $\overline{\text{MREQ0}}$, $\overline{\text{MREQ1}}$ and $\overline{\text{MREQ2}}$ signals are fully backward compatible to the MC92501 Revision A MCIREQ, MCOREQ and EMMREQ signals, respectively. The $\overline{\text{MREQ[n]}}$ signals are used by DMA devices and can be programmed to support DMA requests as follows:
 - MP Cell In Request:* $\overline{\text{MREQ[n]}}$ is an output signal that can be used by an external DMA device as a control line indicating when to start a new cell insertion cycle into the MC92501. It is asserted whenever the Cell Insertion Register array is available to be written. This signal is output on the falling edge of MCLK.
 - MP Cell Out Request:* $\overline{\text{MREQ[n]}}$ is an output signal may be used by an external DMA device as a control line indicating when to start a new cell extraction cycle from the MC92501. It is asserted whenever the Cell Extraction Register array is available to be read. It is output on the falling edge of MCLK.
 - External Memory Maintenance Request:* $\overline{\text{MREQ[n]}}$ is an output signal is asserted a programmable number of clock cycles before the start of an External Memory maintenance cycle. It is deasserted after a programmable number of maintenance accesses have been performed. It is output on the falling edge of MCLK.

Table 1-5. Host Interface Fields

WSSM = 0		WSSM = 1 and DO-Data Order = 0		WSSM = 1 and DO-Data Order=1		Function
MWSH	MWSL	A1	Size	A1	Size	
0	0	x	0	x	0	Write D(31:0)
0	1	0	1	1	1	Write D(31:16)
1	0	1	1	0	1	Write D(15:00)

Note: All Cell Extraction Register, Cell Insertion Register, and General Register accesses are long-word (32-bit) accesses, so both MWSH/A1 and MWSL/SIZE should be asserted low for these write accesses when write-enable mode is selected.

1.5 Ingress PHY Interface Signals

Table 1-6. Ingress PHY Interface Signals

Signal Name	Signal Type	Detailed Description
RXDATA0–RXDATA7	Input	Receive Data Bus —This input data bus receives octets from the PHY chip. When RXENB is active, RXDATA is sampled into the MC92501.
RXPRTY	Input	Receive Data Bus Parity (RXPRTY) —This input is the odd parity over RXDATA. This input is ignored if RXENB is not active or the parity check is disabled.
RXSOC	Input	Receive Start Of Cell (RXSOC) —This input, when high, indicates that the current RXDATA is the first byte of a cell. This input is sampled when RXENB is active.
RXEMPTY	Input	Receive PHY Empty —This input, when low, indicates that currently the PHY chip has no available data.
RXENB	Output	Receive Enable —This output, when low, indicates that the MC92501 is ready to receive data.
RXPHYID0–RXPHYID3	Input	Receive PHY Device ID Bus 0–3 —In UTOPIA level 1, this is an input bus that indicates the ID number of the PHY device currently transferring data to the MC92501. If only a single PHY device is supported, this bus should be tied low. This bus is sampled along with the first octet of each cell.
RXADDR0–RXADDR3	Output	Receive Address 0–3 —In UTOPIA Level 2, this is an output bus that indicates the 4 least significant bits of the ID number of the PHY device which is being polled or selected by the MC92501.
RXADDR4	Output	Receive Address 4 —This signal is an output signal that indicates the most significant bit of the ID number of the PHY device that is being polled or selected by the MC92501.

Note: All inputs are 5 V tolerant.

1.6 Egress PHY Interface Signals

Table 1-7. Egress PHY Interface Signals

Signal Name	Signal Type	Detailed Description
$\overline{\text{TXFULL}}$	Input	Transmit PHY Full —This input signal indicates, when low, that the PHY device is full.
TXDATA0– TXDATA7	Output	Transmit Data Bus —This output data bus transmits octets to the PHY chip. When $\overline{\text{TXENB}}$ is active, TXDATA contains a valid octet for the PHY.
TXPRTY	Output	Transmit Data Bus Parity —This output signal is the odd parity over TXDATA. When $\overline{\text{TXENB}}$ is active, TXPRTY is a valid parity bit for the PHY.
TXSOC	Output	Transmit Start Of Cell —This output signal indicates, when high, that the current data on TXDATA is the first byte of a cell. TXSOC is valid when $\overline{\text{TXENB}}$ is asserted.
$\overline{\text{TXENB}}$	Output	Transmit Enable —This output signal, when low, indicates that TXDATA, TXPRTY, and TXSOC are valid data for the PHY.
$\overline{\text{TXCCLR}}$	Input	Transmit Cell Clear —This input signal indicates, when low, that the current cell should be cleared from the Egress PHY interface.
TXPHYID0– TXPHYID3	Output	Transmit PHY ID 0–3 —In UTOPIA level 1, this is an output bus that indicates the ID number of the PHY device to which either the current cell or the next cell is directed. The functionality is controlled by the MC92501 General Configuration Register (GCR).
TXADDR0– TXADDR3	Output	Transmit Address 0–3 —In UTOPIA level 2, this is an output bus that indicates the 4 least significant bits of the ID number of the PHY device which is being polled or selected by the MC92501.
$\overline{\text{TXPHYIDV}}$	Output	Transmit Next PHY ID Valid —In UTOPIA level 1, this is an output signal that, when low, indicates that TXPHYID (when configured as the next cell's ID) is valid. If TXPHYID is configured to refer to the current cell, $\overline{\text{TXPHYIDV}}$ is not used.
TXADDR4	Output	Transmit Address 4 —In UTOPIA level 2, this an output signal that indicates the most significant bit of the ID number of the PHY device which is being polled or selected by the MC92501.

Note: All inputs are 5 V tolerant.

1.7 PLL Signals

Table 1-8. PLL Signals

Signal Name	Signal Type	Detailed Description
ACLK	Input	ATMC Master Clock —This input signal is used by the PLL to generate the internal master clock of MC92501. The duty cycle should be in the range of 40–60%.
TESTSEL	Input	This is a dedicated test signal that must be grounded during normal system operation.
TESTOUT	Input/Output	This is a dedicated test signal that must be connected to the analog ground (AVSS) during normal system operation.
VCOCTL	Input/Output	This is a dedicated test signal that must be connected to the analog ground (AVSS) during normal system operation.

Note: All inputs are 5 V tolerant.

1.8 External Memory Interface Signals

Table 1-9. External Memory Interface Signals

Signal Name	Signal Type	Detailed Description
EMDATA0–EMDATA31	Input/Output	External Memory Data Bus —This tri-statable bidirectional bus is the data path between the MC92501 and External Memory.
EMADD2–EMADD23	Output	External Memory Address Bus —This output bus is the general address bus used by the MC92501 to access the External Memory.
$\overline{\text{EMWR}}$	Output	External Memory Write —When asserted (low), this output signal indicates that the current cycle to the External Memory is a write cycle. This signal is asserted within the cycle.
$\overline{\text{EMBSH0}}$ – $\overline{\text{EMBSH3}}$	Output	External Memory Bank Select High —These output signals are used to select the high word of the appropriate memory bank. One or more of these signals is asserted for each External Memory access according to the value of EMADD. During a maintenance write access from the microprocessor, the value detected on $\overline{\text{MWSH}}$ is driven on the appropriate $\overline{\text{EMBSH}}$ signal.
$\overline{\text{EMBSL0}}$ – $\overline{\text{EMBSL3}}$	Output	External Memory Bank Select Low —These output signals are used to select the low word of the appropriate memory bank. One or more of these signals is asserted for each External Memory access according to the value of EMADD. During a maintenance write access from the microprocessor, the value detected on $\overline{\text{MWSL}}$ is driven on the appropriate $\overline{\text{EMBSL}}$ signal.

Table 1-9. External Memory Interface Signals (Continued)

Signal Name	Signal Type	Detailed Description
$\overline{\text{EACEN}}$	Output	External Address Compression Enable —This output signal is asserted when data is being written to or read from an external address compression device using the External Memory Data Bus.

Note: All inputs are 5 V tolerant.

1.9 Ingress Switch Interface Signals

Table 1-10. Ingress Switch Interface Signals

Signal Name	Signal Type	Detailed Description
SRXDATA0–SRXDATA7	Output	Receive DATA BUS (SRXDATA0-SRXDATA7) —This three-state output data bus transmits bytes to the switch. When SRXENB is active, SRXDATA contains valid data for the switch. This bus is updated on the rising edge of SRXCLK.
SRXPRTY	Output	Receive Data Bus Parity —This three-state output is the parity protection of SRXDATA transmitted to the switch. The type of parity (even/odd) is defined by the Ingress Switch Interface Configuration Register (ISWCR)..
SRXSOC	Output	Receive Start Of Cell —This three-state output, when high, indicates that the current data on SRXDATA is the first byte of a cell structure (including the overhead bytes).
SRXCLAV	Output	Receive Switch Cell Available —This output, when asserted, indicates that the MC92501 has a cell ready to transfer to the switch. When deasserted, it indicates that currently there is no data available for the switch.
$\overline{\text{SRXENB}}$	Input	Receive Enable —This input, when low, enables new values on SRXDATA, SRXPRTY and SRXSOC.
SRXCLK	Input	Receive Clock —This input is used to clock the Ingress switch interface signals.

Note: All inputs are 5 V tolerant.

1.10 Egress Switch Interface Signals

Table 1-11. Egress Switch Interface Signals

Signal Name	Signal Type	Detailed Description
STXCLAV	Output	Transmit Cell Available —This output, when asserted, indicates that the MC92501 is prepared to receive a complete cell.
STXDATA0–STXDATA7	Input	Transmit Data Bus —This input data bus receives bytes from the switch. When STXENB is asserted, STXDATA is sampled into the MC92501 on the rising edge of STXCLK.
STXPRTY	Input	Transmit Data Bus Parity —This input is the parity over STXDATA. The type of parity (even/odd) and the parity check control are defined by the Egress Switch Interface Configuration Register (ESWCR). This input is ignored if STXENB is deasserted or the parity check is disabled. It is sampled on the rising edge of STXCLK.
STXSOC	Input	Transmit Start Of Cell —This input indicates, when high, that the current data is the first byte of a cell structure (including the overhead bytes). This input is sampled on the rising edge of STXCLK when STXENB is asserted.
$\overline{\text{STXENB}}$	Input	Transmit Enable —This input, when low, enables STXDATA, STXPRTY, and STXSOC.
STXCLK	Input	Transmit Clock —This input signal is used to clock the Egress switch interface signals.

Note: All inputs are 5 V tolerant.

1.11 JTAG Interface Signals

Table 1-12. JTAG Interface Signals

Signal Name	Signal Type	Detailed Description
TCK	Input	Test Clock —This input pin is the JTAG clock. The TDO, TDI, and TMS pins are synchronized by this signal.
TMS	Input	Test Mode Select —This input signal is sampled on the rising edge of TCK. TMS is responsible for the state change in the test access port state machine.
TDI	Input	Test Data Input —This input signal is sampled on the rising edge of TCK. TDI is the data to be shifted toward the TDO output.
$\overline{\text{TRST}}$	Input	Test Reset —This input signal is the JTAG asynchronous reset. When asserted low, the Test Access Port is forced to the Test_Logic_Reset state. When JTAG is not being used, this signal should be hard-wired to GND or tied to ARST.
TDO	Output	Test Data Output —This tri-state output changes its logical value on the falling edge of TCK.

Note: All inputs are 5 V tolerant.

Signal and Packaging Information

2.1 Introduction

This section provides information on packaging, including a diagram of the package with signals and tables showing how the signals described in **Section 1** are allocated. The MC92501 is available in a 256-lead Glob-Top Ball Grid Array (GTBGA) package. The package mechanical drawing is provided at the end of this section.

2.2 GTBGA Package Description

A GTBGA package top view is shown in **Figure 2-1** with signal and location designators.

- Notes:**
1. Locations marked as *nc* must not be connected.
 2. The figure only shows the primary signal name for each lead. For the Ingress and Egress PHY Interface signals, the primary signal names are those used in UTOPIA Level 1. For UTOPIA Level 2, leads R3, T2, T3, U1, and Y3 change to TXADDR0, TXADDR1, TXADDR3, TXADDR2, and TXADDR4, respectively. The Microprocessor signals also have an alternate configuration that changes leads A10 and A11 to signals A1 and SIZE, respectively.

Figure 2-1. MC92501 256-Lead GTBGA Diagram (Top View)

2.3 GTBGA Mechanical Drawing

Figure 2-2. Glob-Top Ball Grid Array (GTBGA) Package

Specifications

3.1 Introduction

This section provides the following sets of physical and electrical specifications for the MC92501:

- Absolute Maximum Ratings
- Recommended Operating Conditions
- DC Electrical Characteristics
- Clocks
- Microprocessor Interface Timing
- PHY Interface Timing
- Switch Interface Timing
- External Memory Interface Timing

3.2 Absolute Maximum Ratings

Table 3-1. Absolute Maximum Ratings

Symbol	Parameter	Value/Value Range ¹	Unit
V_{DD}	DC Supply Voltage	-0.5 to 3.8	V
V_{IN} ²	DC Input Voltage (5 V Tolerant)	-0.5 to 5.8	V
V_{OUT} ^{2,3}	DC Output Voltage	-0.5 to $V_{DD} + 0.5$	V
I	DC Current Drain per Pin, Any Single Input or Output	±50	mA
I	DC Current Drain VDD and VSS Pins	±100	mA
T_{STG}	Storage Temperature	-65 to +150	°C
T_L	Lead Temperature (10 s soldering)	300	°C

- Notes:**
1. Maximum ratings are those values beyond which damage to the device may occur.
 2. All input, bidirectional, and MDTACK are 5 V Tolerant. For proper operation it is recommended that V_{in} and V_{out} be constrained to $0 \leq (V_{IN}, V_{OUT}) \leq 5.5$ V.
 3. SRXDATAx, SRXSOC, SRXPRTY, TDO tri-state outputs must be constrained to $0 \leq V_{OUT} \leq V_{DD}$ in the high impedance state.
 4. This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

3.3 Recommended Operating Conditions

Table 3-2. Recommended Operating Conditions to Guarantee Functionality

Symbol	Parameter	Min	Max	Unit
V_{DD}	DC Supply Voltage, $V_{DD} = 3.3$ V (Nominal)	3.0	3.6	V
V_{in}	Input Voltage (5V Tolerant)	0	5.5	V
T_A	Industrial Operating Temperature	-40	85	°C

- Notes:**
1. All parameters are characterized for DC conditions after thermal equilibrium has been established.
 2. Unused inputs must always be tied to an appropriate logic voltage level (e.g., either V_{SS} or V_{DD}).
 3. This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

3.4 DC Electrical Characteristics

Table 3-3. DC Electrical Characteristics

Symbol	Parameter	Condition	Min.	Max.	Unit
V_{IH}	TTL Inputs (5V Tolerant)	—	2.2	5.5	V
V_{IL}	TTL Inputs (5V Tolerant)	—	-0.3	0.8	V
I_{IN}	Input Leakage Current, No Pull Resistor	$V_{IN} = V_{DD}$ or V_{SS}	-5	5	μA
	With Pullup Resistor *		-50	-5	
	With Pulldown Resistor *		5	50	
I_{OH}	Output High Current, LVTTL Output Type Outputs: $\overline{\text{EACEN}}$, $\overline{\text{EMWR}}$, $\overline{\text{EMADDx}}$, $\overline{\text{EMBSHx}}$, $\overline{\text{EMBSLx}}$	$V_{DD} = \text{Min}$, $V_{OH} \text{ Min} = 0.8 V_{DD}$	-24	—	mA
	Output High Current, LVTTL Output Type Outputs: All other outputs		-4	—	
I_{OL}	Output Low Current, LVTTL Output Type Outputs: $\overline{\text{EACEN}}$, $\overline{\text{EMWR}}$, $\overline{\text{EMADDx}}$, $\overline{\text{EMBSHx}}$, $\overline{\text{EMBSLx}}$	$V_{DD} = \text{Min}$, $V_{OL} \text{ Max} = 0.4 V$	24	—	mA
	Output Low Current, LVTTL Output Type Outputs: All other outputs		4	—	
I_{OZ}	Output Leakage Current, Tri-State Output	Output = High Impedance $V_{OUT} = V_{DD}$ or V_{SS}	-10	10	μA
I_{DDQ}	Max Quiescent Supply Current	$I_{OUT} = 0 \text{ mA}$ $V_{IN} = V_{DD}$ or V_{SS}	10		μA
I_{DD}	Max Dynamic Supply Current	Nominal Load Capacitance, ACLK = 25.6 Mhz, MCLK = 33 Mhz	300 ¹		mA
C_I	Input Capacitance (TTL)	—	—	8	pF

- Notes:**
- Under Typical Loca, 25 Mhz ACLK/MCLK
 - $T_A = -40^\circ\text{C}$ to 85°C , $V_{DD} = 3.3 \text{ V} \pm 0.3 \text{ V}$ Guaranteed
 - Inputs may be modified to include pullup resistors at any time.
 - See **Section 1** for pin input/output type.

3.5 Clocks

Table 3-4. Clock Timing

Num	Characteristics	Min	Max	Unit
C1	ACLK Cycle Time	39	80	ns
C2	ACLK Pulse Width Low	15	—	ns
C3	ACLK Pulse Width High	15	—	ns
C4	ACLK Rise/Fall Time	—	5	ns
C5	MCLK Cycle Time	30	—	ns
C6	MCLK Pulse Width Low	12	—	ns
C7	MCLK Pulse Width High	12	—	ns
C8	MCLK Rise/Fall Time	—	5	ns
C9	SRXCLK/STXCLK Cycle Time	30	—	ns
C10	SRXCLK/STXCLK Pulse Width Low	12	—	ns
C11	SRXCLK/STXCLK Pulse Width High	12	—	ns
C12	SRXCLK/STXCLK Rise/Fall Time	—	5	ns

Figure 3-1. Clock Timing Diagrams

3.6 Microprocessor Interface Timing

The timing diagrams in this section are intended to convey setup and hold values for input signals and propagation delay values for output signals. For functional timing diagrams, see Section 4.5 Microprocessor Interface.

Table 3-5. Microprocessor Interface Timings

Num	Characteristics	Min	Max	Unit
1	$\overline{\text{MSEL}}$ setup time before MCLK falling edge	5		ns
2	$\overline{\text{MSEL}}$ hold time after MCLK falling edge	1		ns
3	MADD/ $\overline{\text{MWR}}$ setup time before $\overline{\text{MSEL}}$ assertion	5		ns
4	MADD/ $\overline{\text{MWR}}$ hold time after MCLK falling edge ¹	3		ns
5	$\overline{\text{MDS}}$ setup time before MCLK falling edge	5		ns
6	$\overline{\text{MDS}}$ hold time after MCLK falling edge	1		ns
7	MDATA setup time before MCLK falling edge	4		ns
8	MDATA hold time after MCLK falling edge	1		ns
9	$\overline{\text{MSEL}}$ assertion to MDATA active	0		ns
11	MCLK falling edge to MDATA valid for CER Accesses ²		26	ns
12	$\overline{\text{MSEL}}$ deassertion to MDATA invalid	1		ns
13	$\overline{\text{MSEL}}$ deassertion to MDATA inactive		11	ns
14	$\overline{\text{MWR}}$ assertion to MDATA invalid	1		ns
15	$\overline{\text{MWR}}$ assertion to MDATA inactive		11	ns
16	MCLK rising edge to MDATA valid for Maintenance Accesses ^{2,3}		T_D	ns
17	MCLK falling edge to MDATA valid for General Register Accesses ^{2,4}		T_R	ns
19	$\overline{\text{MSEL}}$ assertion to $\overline{\text{MDTACK}}$ active	0		ns
20	MCLK falling edge to $\overline{\text{MDTACK}}$ inactive		12	ns
21	$\overline{\text{MSEL}}$ assertion to $\overline{\text{MDTACK0}}$ asserted ⁵		9	ns
22	$\overline{\text{MSEL}}$ deassertion to $\overline{\text{MDTACK}}$ deasserted ⁵		13	ns
23	MCLK rising edge to $\overline{\text{MDTACK}}$ asserted ⁵		13	ns
24	$\overline{\text{MWSH}}$, $\overline{\text{MWSL}}$ setup time before MCLK falling edge ¹	2		ns
25	$\overline{\text{MWSH}}$, $\overline{\text{MWSL}}$ hold time after MCLK falling edge ¹	3		ns
26	MCLK falling edge to $\overline{\text{REQ}}$ valid	0	14	ns

Table 3-5. Microprocessor Interface Timings (Continued)

Num	Characteristics	Min	Max	Unit
27	MCLK falling edge to $\overline{\text{MDTACK}}$ asserted for General Register Read Accesses ^{5,6}		T_{RD}	ns
28	MCLK falling edge to $\overline{\text{MDTACK}}$ asserted for General Register Write Accesses ^{5,7}		T_{WD}	ns
29	Access width (MCLK falling edge to $\overline{\text{MSEL}}$ deassertion) for General Register Write Accesses ⁸	T_W		
30	$\overline{\text{MSEL}}$ assertion to $\overline{\text{MDTACK1}}$ asserted ⁹		12	ns
31	$\overline{\text{MDTACK0}}$ assertion to $\overline{\text{MDTACK1}}$ assertion	0	5	ns

- Notes:**
1. This refers only to the first falling edge of MCLK in each access at which $\overline{\text{MSEL}}$ is asserted.
 2. This is for a 150 pF load. Add 0.9 ns for each additional 10 pF. For a 100 pF load, subtract 4 ns.
 3. T_D = External Memory access time + 18 ns
 4. T_R = 4 * ACLK period + 20 ns
 5. This is for a 50 pF load.
 6. T_{RD} = 4 * ACLK period + 11 ns
 7. T_{WD} is measured from the MCLK falling edge at which $\overline{\text{MDS}}$ is sampled as asserted.
 T_{WD} = 4 * ACLK period + 11 ns
 8. T_W is measured from the MCLK falling edge at which MDS is sampled as asserted. T_W = 4 * ACLK period. Note that the setup and hold times with respect to MCLK (timing values 1 and 2) still apply.
 9. This is for a 50 pF load.

3.7 PHY Interface Timing

Table 3-6. PHY Interface Timings

Num	Characteristics	Min	Max	Unit
51	Setup time before ACLK rising edge	10	—	ns
52	Hold time after ACLK rising edge	1	—	ns
53	Propagation delay from rising edge of ACLK ¹	1	16 ²	ns

Notes: 1. For a 200 pF load. Add 0.25 ns for each additional 10 pF. For 100 pF subtract 2.5 ns.
 2. 16 ns for 70°C, 17 ns for 85°C

Figure 3-8. Receive PHY Interface Timing

Figure 3-9. Transmit PHY Interface Timing

3.8 Switch Interface Timing

Table 3-7. Switch Interface Timing

Num	Characteristics	Min	Max	Unit
61	Setup time before SRXCLK/STXCLK rising edge	4		ns
62	Hold time after SRXCLK/STXCLK rising edge	1		ns
63	Propagation delay from rising edge of SRXCLK/STXCLK	1	18	ns
64	SRXCLK rising edge to outputs active	1		
65	SRXCLK rising edge to outputs inactive	1	16	

Figure 3-10. Ingress Switch Interface Timing

Figure 3-11. Egress Switch Interface Timing

3.9 External Memory Interface Timing

This section represents External Memory timing parameters for the default definition of the External Memory Timing Configuration Register (EMTCR). These values are for a load of up to 50 pF, which is the rated maximum load for the External Memory interface pins.

3.9.1 Write Cycle Timing

Table 3-8. Write Cycle Timing

Num	Characteristics	Min	Max	Unit
81	Write Pulse Width	16	—	ns
82	$\overline{\text{EMWR}}$ assertion time. $\overline{\text{EMWR}}$ low to end of Write.	22	—	ns
83	Address Setup Time. EMADD Valid to Beginning of Write.	6	—	ns
84	Address Valid Time. During this Time EMADD is Valid.	32	—	ns
85	Address Hold Time. End of Write to EMADD Invalid.	6	—	ns
87	Data Setup Time. EMDATA Valid to End of Write.	13	—	ns
88	Data Hold Time. End of Write to EMDATA Invalid.	6	—	ns
Note: A write occurs during the overlap of $\overline{\text{EMBSH0-3}}$, $\overline{\text{EMBSL0-3}}$, $\overline{\text{EACEN}}$ low and $\overline{\text{EMWR}}$ low.				

Figure 3-12. External Memory Write Access Timing

3.9.2 Read Cycle Timing

Table 3-9. Read Cycle Timing

Num	Characteristics	Min	Max	Unit
90	Enable Pulse Width. $\overline{\text{EMB}}\text{SH}0\text{--}\overline{\text{EMB}}\text{SH}3$, $\overline{\text{EMB}}\text{SL}0\text{--}\overline{\text{EMB}}\text{SL}3$, $\overline{\text{EACEN}}$ Pulse Width.	28	—	ns
92	Address Setup Time. $\overline{\text{EMB}}\text{SH}0\text{--}\overline{\text{EMB}}\text{SH}3$, $\overline{\text{EMB}}\text{SL}0\text{--}\overline{\text{EMB}}\text{SL}3$, $\overline{\text{EACEN}}$ High.	33	—	ns
93	Address Hold Time. $\overline{\text{EMADD}}$ Invalid to $\overline{\text{EMB}}\text{SH}0\text{--}\overline{\text{EMB}}\text{SH}3$, $\overline{\text{EMB}}\text{SL}0\text{--}\overline{\text{EMB}}\text{SL}3$, $\overline{\text{EACEN}}$ High	—	1 ¹	ns
94	Data Driving Start Point. $\overline{\text{EMB}}\text{SH}0\text{--}\overline{\text{EMB}}\text{SH}3$, $\overline{\text{EMB}}\text{SL}0\text{--}\overline{\text{EMB}}\text{SL}3$, $\overline{\text{EACEN}}$ Low to $\overline{\text{EMDATA}}$ Active.	0	—	ns
95	Data Setup Time. $\overline{\text{EMDATA}}$ Valid to $\overline{\text{EMB}}\text{SH}0\text{--}\overline{\text{EMB}}\text{SH}3$, $\overline{\text{EMB}}\text{SL}0\text{--}\overline{\text{EMB}}\text{SL}3$, $\overline{\text{EACEN}}$ High.	5	—	ns
96	Data Hold Time. $\overline{\text{EMB}}\text{SH}0\text{--}\overline{\text{EMB}}\text{SH}3$, $\overline{\text{EMB}}\text{SL}0\text{--}\overline{\text{EMB}}\text{SL}3$, $\overline{\text{EACEN}}$ High to $\overline{\text{EMDATA}}$ Invalid.	0	—	ns
97	Data Driving End Point. $\overline{\text{EMB}}\text{SH}0\text{--}\overline{\text{EMB}}\text{SH}3$, $\overline{\text{EMB}}\text{SL}0\text{--}\overline{\text{EMB}}\text{SL}3$, $\overline{\text{EACEN}}$ High to $\overline{\text{EMDATA}}$ Inactive ²	—	9	ns

- Notes:**
1. A RAM with hold time from address change to data change is required.
 2. Failure to meet this value may result in contention on $\overline{\text{EMDATA}}$ if a write access follows.

Figure 3-13. External Memory Read Access Timing

Test Information

4.1 Device Identification Register

The code for the MC92501 is 0100_0001_1100_0011_1010_0000_0001_1101.

4.2 Boundary Scan Register

Table 4-1. MC92501 Boundary Scan Bit Definition

Signal Name	I/O Cell Type	System Mode	Scan Bit #		Output Enable

Motorola reserves the right to make changes without further notice to any products herein. Motorola makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Motorola assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters which may be provided in Motorola data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals", must be validated for each customer application by customer's technical experts. Motorola does not convey any license under its patent rights nor the rights of others. Motorola products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Motorola product could create a situation where personal injury or death may occur. Should Buyer purchase or use Motorola products for any such unintended or unauthorized application, Buyer shall indemnify and hold Motorola and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Motorola was negligent regarding the design or manufacture of the part.
