DESCRIPTION

The S54S113 and N74S113 offer individual J, K, preset, and clock inputs. The S54S114 and N74S114 offer common clock and common clear inputs and individual J, K, and preset inputs.

These monolithic dual flip-flops are designed so that when the clock goes high, the inputs are enabled and data will be accepted. The logic level of the J and K inputs may be allowed to change when the clock pulse is high and the bistable will perform according to the truth table as long as minimum setup times are observed. Input data are transferred to the outputs on the negative-going edge of the clock pulse.

TRUTH TABLE

t_n		t_{n+1}
J	K	Q
L	L	Q_n
L	H	L
H	L	H
H	H	$\overline{Q_n}$

NOTES:

- A. t_n = bit time before clock pulse
- B. t_{n+1} = bit time after clock pulse

* For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable device type. See Figures 64 through 69 of the Series 54H/74H section for test circuits.

** All typical values are at $V_{CC} = 5V$, $T_A = 25^\circ C$.

† Not more than one output should be shorted at a time, and duration of the short-circuit test should not exceed one second.

NOTE 1: I_{CC} is measured with outputs open, clock grounded, and J, K, preset, and clear at 4.5V.
