## VARIABLE Q FILTER

## DESCRIPTION

## APPLICATIONS

The ZXF103 is a versatile analog high Q bandpass filter. It can be configured to provide pass or notch characteristics.

The basic filter section requires 2 resistors and 2 capacitors to set the centre frequency. The frequency range is up to 600 kHz . Two external resistors control filter Q Factor. The Q can be varied up to 50.

## ORDERING INFORMATION

| PART NUMBER | PACKAGE | PART <br> MARK |
| :--- | :--- | :--- |
| ZXF103Q16 | QSOP16 | ZXF103 |

| PART NUMBER | CONTAINER | INCREMENT |
| :--- | :--- | :--- |
| ZXF103Q16TA | Reel 7" <br> 178 mm | 500 |
| ZXF103Q16TC | Reel 13" <br> 330 mm | 2500 |

Many filter applications including: -

- Sonar and Ultrasonic Systems
- Line frequency notch
- Signalling
- Motion detection
- Instrumentation
- Low frequency telemetry

## FEATURES AND BENEFITS

- Centre Frequency up to 1 MHz
- Variable Q up to 50
- Low distortion
- Low noise
- Low power 25mW
- Devices easily cascaded
- Small QSOP16 package

## AC Filter Performance

Frequency (Hz)
$F o=\frac{1}{2 \pi R C}$
where $R=R 1=R 2$
and $\mathrm{C}=\mathrm{C} 1=\mathrm{C} 2$
$Q \propto \frac{R 4}{R 3}$
where $\mathrm{R} 1, \mathrm{R} 2, \mathrm{R} 3$ and $\mathrm{R} 4 \geqslant 2 \mathrm{k} \Omega$ and $C 1$ and $C 2 \geqslant 50 p F$

Filter Configurations and Responses (Continued) Inverse Notch Filter (with attenuating skirts)

$\mathrm{Fo}=\frac{1}{2 \pi \mathrm{RC}}$
where $\mathrm{R}=\mathrm{R} 1=\mathrm{R} 2$
and $\mathrm{C}=\mathrm{Cl}=\mathrm{C} 2$
$\mathrm{Q} \propto \frac{\mathrm{R} 4}{\mathrm{R} 3}$
where $R 1, R 2, R 3$ and $R 4 \geqslant 2 k \Omega$ and C 1 and $\mathrm{C} 2 \geqslant 50 \mathrm{pF}$

See "Designing for a value of Q" for more details.

The skirt 'roll off' away from the peak is $-20 \mathrm{~dB} /$ Decade regardless of chosed Q.

Typical responses from the circuit with component values derived from the diagram.

## ZXF103

## Designing for a value of $Q$

As mentioned on the configuration pages, there is a proportional relationship between the ratio of R4 and R3, and Q .
$\mathrm{Q} \propto \frac{\mathrm{R} 4}{\mathrm{R} 3}$
These resistors define the gain of an inverting amplifier that determines the peak value of gain and therefore the $Q$ of the filter, as $Q$ is described as;
$Q=\frac{\text { Fo }}{-3 \mathrm{dBBandwidth}}$
This value of required gain is quite critical. As the maximum value of $Q$ is approached, too much gain will cause the filter to oscillate at the centre frequency Fo. A small reduction of gain will cause the value of $Q$ to fall significantly. Therefore, for high values of $Q$ factor or tight tolerances of lower values of $Q$, the resistor ratio must be trimmed.

Frequency dependant effects must be accounted for in determining the appropriate gain. As the frequency increases, the effective circuit gain reduces. The required gain is nominally two but at higher frequencies it will need to be slightly greater than two in order to compensate for loss of gain and internal phase shifts.

This is not really a problem for circuits where the desired Fo remains constant, as the phase shifts are accounted for permanently. For designs where $Q$ is high and $F o$ is to be 'swept', care must be taken that a gain appropriate at the highest frequency does not cause oscillation at the lowest.

Variation in $Q$ increases from device to device, as the value of $Q$ increases, due to internal gain spreads.

## Evaluation Board Schematic

The evaluation board is designed for operation at 70 kHz .
